Module 3 Project

Adding Tables to our PDFs

Up to now, we've generated an extra simple PDF file, that just includes a title.

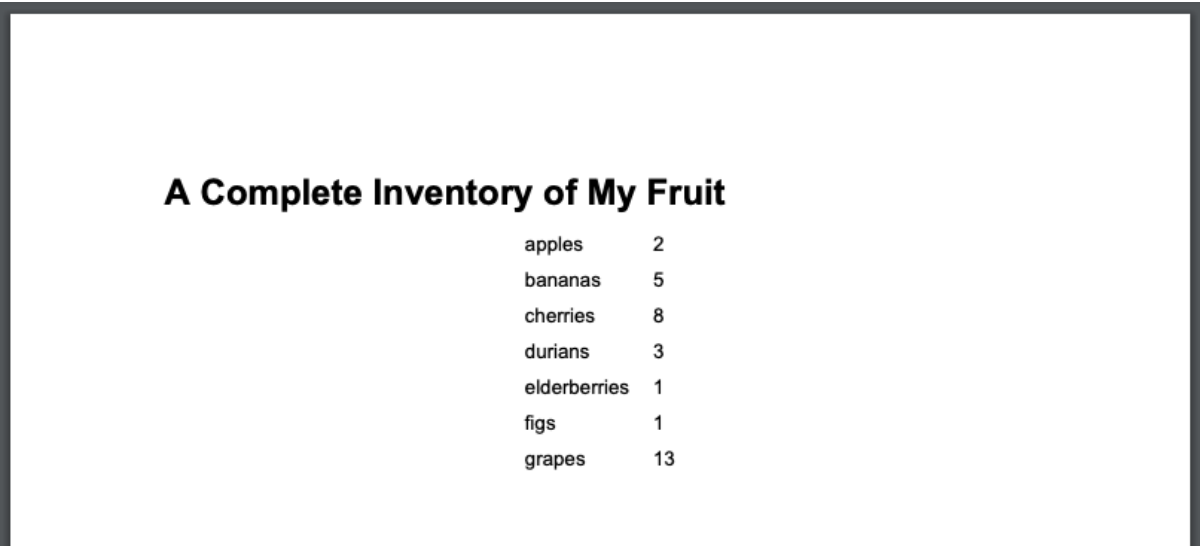

Let's spice this up by adding a **Table**. To make a Table object, we need our data to be in a **list-of-lists**, sometimes called a **two-dimensional array**. We have our inventory of fruit in a dictionary. How can we convert a dictionary into a list-of-lists?

```
1 >>> table_data = []
2 >>> for k, v in fruit.items():
3 ...     table_data.append([k, v])
4 ...
5 >>> print(table_data)
6 [['elderberries', 1], ['figs', 1], ['apples', 2], ['durians', 3], ['bananas', 5], ['cherries', 8], ['grapes', 13]]
```

Great, we have the list of lists. We can now add it to our report and then generate the PDF file once again by calling the **build** method.

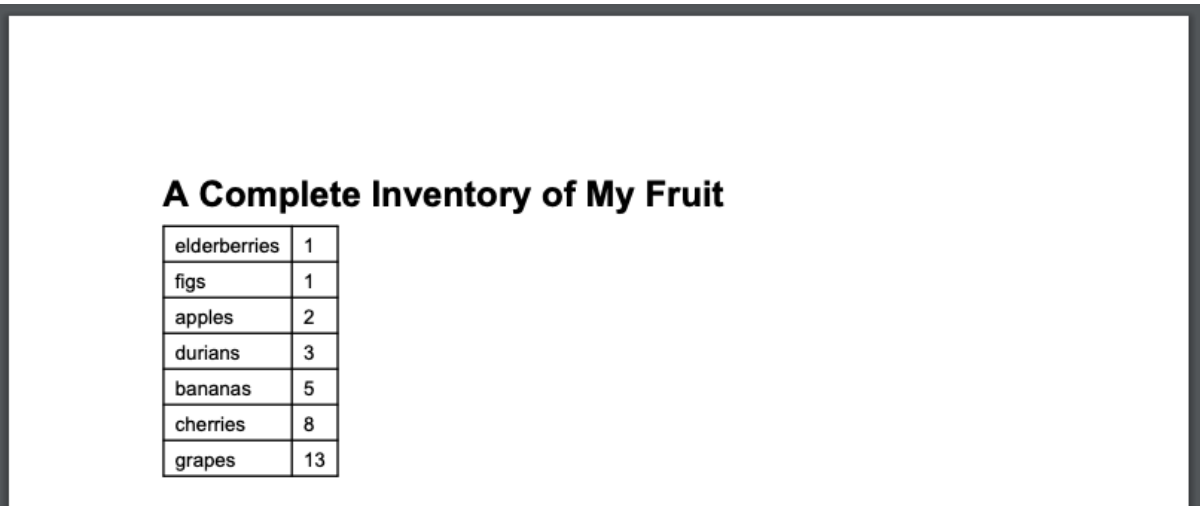

```
1 >>> report_table = Table(data=table_data)
2 >>> report.build([report_title, report_table])
```

And this is how the generated report looks now:

Okay, it worked! It's not very easy to read, though. Maybe we should add some style to **report_table**. For our example, we'll add a border around all of the cells in our table, and move the table over to the left. **TableStyle** definitions can get pretty complicated, so feel free to take a look at the documentation for a more complete idea of what's possible.

```
1 >>> from reportlab.lib import colors
2 >>> table_style = [('GRID', (0,0), (-1,-1), 1, colors.black)]
3 >>> report_table = Table(data=table_data, style=table_style, hAlign="LEFT")
4 >>> report.build([report_title, report_table])
```

Much better! Up next, we'll look into making this more colorful by adding graphs to our reports.
