 A declarative language defines the goal; a procedural language defines the steps to achieve a goal. Declarative languages are object-based; procedural languages aren't. Declarative languages aren't stateless; procedural languages are stateless. A declarative language defines each step required to reach the goal state. Correct Right correct Ricc goal state we want to be in, without explicitly programming steps for how to achieve that state. Puppet facts are stored in hashes. If we wanted to use a conditional statement to perform a specific action based on a fact value, what symbol must precede the facts variable for the Puppet DSL to recognize it? @ # \$ \$ & Correct Nice job! All variable names are preceded by a dollar sign in Puppet's DSL. What does it mean that Puppet is stateless? Puppet retains information between uses. An action can be performed repeatedly without changing the system after the first run. There is no state being kept between runs of the agent. Actions are taken only when they are necessary to achieve a goal. Correct Avesomel Stateless means there is no record of previous interactions, and each interaction request has to be handled based entirely on information that comes with it. 			
 ♠ A declarative language defines the goal; a procedural language defines the steps to achieve a goal. ○ Declarative languages are object-based; procedural languages arent. ○ Declarative languages arent stateless: procedural languages are stateless. ○ A declarative language defines each step required to reach the goal state. ② Correct Right onl in a declarative language, it's important to correctly define the end state we want to be in, without explicitly programming steps for how to achieve that state. Puppet facts are stored in hashes. If we wanted to use a conditional statement to perform a specific action based on a fact value, what symbol must precede the facts variable for the Puppet DSL to recognize it? ② ② # ② Correct Nice job! All variable names are preceded by a dollar sign in Puppet's DSL. What does it mean that Puppet is stateless? ○ Puppet retains information between uses. ○ An action can be performed repeatedly without changing the system after the first run. ④ There is no state being kept between runs of the agent. ○ Actions are taken only when they are necessary to achieve a goal. ② Correct Awesome! Stateless means there is no record of previous interactions, and each interaction request has to be handled based entirely on information that comes with it. What does the "test and repair" paradigm mean in practice? ○ There is no state being kept between runs of the agent. ○ We should plan to repeatedly fix issues. ○ We need to test before and after implementing a fix. 			
O Declarative languages are object-based; procedural languages aren't. ○ Declarative languages aren't stateless; procedural languages are stateless. ○ A declarative language defines each step required to reach the goal state. ② Correct Right on! In a declarative language, it's important to correctly define the end state we want to be in, without explicitly programming steps for how to achieve that state. Puppet facts are stored in hashes.  \$ & Correct Nice job! All variable names are preceded by a dollar sign in Puppet's DSL. What does it mean that Puppet is stateless? Puppet retains information between uses. An action can be performed repeatedly without changing the system after the first run. There is no state being kept between runs of the agent. Actions are taken only when they are necessary to achieve a goal. Correct Awesome! Stateless means there is no record of previous interactions, and each interaction request has to be handled based entirely on information that comes with it. What does the "test and repair" paradigm mean in practice? There is no state being kept between runs of the agent. We should plan to repeatedly fix issues. We need to test before and after implementing a fix. 	•	based on a fact value, what symbol must precede the facts variable for the Puppet DSL to recognize it?	1 / 1 p
 		O #	
 ✓ Correct Nice job! All variable names are preceded by a dollar sign in Puppet's DSL. What does it mean that Puppet is stateless? ✓ Puppet retains information between uses. ✓ An action can be performed repeatedly without changing the system after the first run. ⑥ There is no state being kept between runs of the agent. ✓ Actions are taken only when they are necessary to achieve a goal. ✓ Correct Awesome! Stateless means there is no record of previous interactions, and each interaction request has to be handled based entirely on information that comes with it. What does the "test and repair" paradigm mean in practice? ✓ There is no state being kept between runs of the agent. ✓ We should plan to repeatedly fix issues. ✓ We need to test before and after implementing a fix. 		\$	
Nice job! All variable names are preceded by a dollar sign in Puppet's DSL. What does it mean that Puppet is stateless? Puppet retains information between uses. An action can be performed repeatedly without changing the system after the first run. There is no state being kept between runs of the agent. Actions are taken only when they are necessary to achieve a goal. Correct Awesome! Stateless means there is no record of previous interactions, and each interaction request has to be handled based entirely on information that comes with it. What does the "test and repair" paradigm mean in practice? There is no state being kept between runs of the agent. We should plan to repeatedly fix issues. We need to test before and after implementing a fix.		○ &	
 Puppet retains information between uses. An action can be performed repeatedly without changing the system after the first run. There is no state being kept between runs of the agent. Actions are taken only when they are necessary to achieve a goal. ✓ Correct Awesome! Stateless means there is no record of previous interactions, and each interaction request has to be handled based entirely on information that comes with it. What does the "test and repair" paradigm mean in practice? There is no state being kept between runs of the agent. We should plan to repeatedly fix issues. We need to test before and after implementing a fix. 			
 Puppet retains information between uses. An action can be performed repeatedly without changing the system after the first run. There is no state being kept between runs of the agent. Actions are taken only when they are necessary to achieve a goal. ✓ Correct Awesome! Stateless means there is no record of previous interactions, and each interaction request has to be handled based entirely on information that comes with it. What does the "test and repair" paradigm mean in practice? There is no state being kept between runs of the agent. We should plan to repeatedly fix issues. We need to test before and after implementing a fix. 			
 An action can be performed repeatedly without changing the system after the first run. ● There is no state being kept between runs of the agent. ○ Actions are taken only when they are necessary to achieve a goal. ② Correct Awesome! Stateless means there is no record of previous interactions, and each interaction request has to be handled based entirely on information that comes with it. What does the "test and repair" paradigm mean in practice? 1/11 ○ There is no state being kept between runs of the agent. ○ We should plan to repeatedly fix issues. ○ We need to test before and after implementing a fix. 	3.	What does it mean that Puppet is stateless?	1/1 p
 There is no state being kept between runs of the agent. Actions are taken only when they are necessary to achieve a goal. Correct Awesome! Stateless means there is no record of previous interactions, and each interaction request has to be handled based entirely on information that comes with it. What does the "test and repair" paradigm mean in practice? There is no state being kept between runs of the agent. We should plan to repeatedly fix issues. We need to test before and after implementing a fix. 		O Puppet retains information between uses.	
 ○ Actions are taken only when they are necessary to achieve a goal. ○ Correct Awesome! Stateless means there is no record of previous interactions, and each interaction request has to be handled based entirely on information that comes with it. What does the "test and repair" paradigm mean in practice? 1/1 ○ There is no state being kept between runs of the agent. ○ We should plan to repeatedly fix issues. ○ We need to test before and after implementing a fix. 		An action can be performed repeatedly without changing the system after the first run.	
 ✓ Correct Awesome! Stateless means there is no record of previous interactions, and each interaction request has to be handled based entirely on information that comes with it. What does the "test and repair" paradigm mean in practice? There is no state being kept between runs of the agent. ✓ We should plan to repeatedly fix issues. ✓ We need to test before and after implementing a fix. 		There is no state being kept between runs of the agent.	
Awesome! Stateless means there is no record of previous interactions, and each interaction request has to be handled based entirely on information that comes with it. What does the "test and repair" paradigm mean in practice? There is no state being kept between runs of the agent. We should plan to repeatedly fix issues. We need to test before and after implementing a fix.		Actions are taken only when they are necessary to achieve a goal.	
 There is no state being kept between runs of the agent. We should plan to repeatedly fix issues. We need to test before and after implementing a fix. 		Awesome! Stateless means there is no record of previous interactions, and each interaction request has to	
 There is no state being kept between runs of the agent. We should plan to repeatedly fix issues. We need to test before and after implementing a fix. 			
We should plan to repeatedly fix issues.We need to test before and after implementing a fix.	١.	What does the "test and repair" paradigm mean in practice?	1/1 p
We need to test before and after implementing a fix.		There is no state being kept between runs of the agent.	
		We should plan to repeatedly fix issues.	
We should only take actions when testing determines they need to be done to reach the requested state		We need to test before and after implementing a fix.	
		We should only take actions when testing determines they need to be done to reach the requested state	

⊘ Correct

Great work! By checking to see if a resource requires modification first, we can avoid wasting precious time.

5.	Where, in Puppet syntax, are the attributes of a resource found?	1 / 1 point
	Inside the curly braces after the resource type	
	O In brackets after the if statement	
	O After ensure =>	
	After the dollar sign (\$)	
	(Correct	

Woohoo! We specify the package contents inside the curly braces, placed after the package title.
